Hereby BASF provides information concerning the maximum percentage of the parts in a BASF product's molecule(s) derived from palm kernel oil (PKO).
The maximum percentage stated below is based on the following assumptions:

- The calculations of the percentages refer exclusively to the products as specified by BASF.
- Our derivatives are based on different vegetable oils with the biggest share coming from palm kernel (PKO) and coconut oil (CNO). We use these oils according to the actual need in our processes. The share may vary between BASF manufacturing sites and may also fluctuate based on market availability. For your reference, please, find the global production ratio below.[1]In very seldom cases also palm oil may be used.
- Taking this into account the figures provided herewith are based on the assumption of an exclusive use of palm kernel oil (including the consideration of glycerin) in our products and therefore represent the maximum possible percentage of the palm kernel oil derived part of the molecule.
- Rounding differences due to calculation scheme have been accounted for.

Accordingly the maximum percentage of parts derived from palm kernel oil (PKO) in the product(s) stated below is as follows:

Anasensyl® LS 9322 0 %

[1]According to the "Oil World Annual 2017, ISTA Mielke" statistics the global coconut – palm kernel oil production ratio is at approx. 32:68 on a 5 year average for the years 2012-2016.
